

PRODUCTION, INVENTORY, FULFILMENT, WASTAGE & JOB WORK MODULE

OWNER REVIEW – REVISED DEVELOPMENT REQUIREMENTS / CHANGE DOCUMENT

1. Purpose of This Revision

This document contains the changes and additional requirements received after presenting the Production and Inventory Module to the Owner.

These requirements should be treated as an **update to the previously approved Production, Inventory and Quality Control Module**.

Where any requirement in this document conflicts with the previous document, **this revised document will take priority**.

The major changes are related to:

- Production Run workflow
 - Product-based fulfilment
 - Processed Inventory-based fulfilment
 - Sortex vs Full Process logic
 - Wastage Inventory
 - Wastage reprocessing
 - Inventory UI and graphical representation
 - Sampling logic for Russia
 - Default quantity unit
 - Outside Warehouse location
 - Job Work processing
 - Job Work inward/outward tracking
 - Job Work reconciliation
 - Re-Sortex of material received from Job Work
-

2. MAJOR ARCHITECTURAL CHANGE – PRODUCTION AND FULFILMENT MUST BE SEPARATE

The most important change is that **Container Fulfilment** should no longer happen inside the **Production Run**.

The revised flow should be:

Raw Material Inventory → Production Run → Production Finalisation → Processed Inventory → Fulfilment → Sampling if applicable → Ready for Dispatch

Therefore:

Production Run is responsible for:

- Selecting input material
- Selecting process
- Processing material
- Entering wastage
- Deciding which wastage is stored/discarded
- Calculating final processed output
- Moving the final good output into Processed Inventory

Fulfilment is responsible for:

- Selecting available processed product
- Showing only contracts requiring that product
- Allocating processed inventory to contracts/containers
- Updating pending quantities
- Sending applicable containers to Sampling

Production Run must no longer directly allocate material to contracts or containers.

This separation is required throughout the application.

3. REVISED PRODUCTION RUN CREATION FLOW

When clicking **New Run**, the system should first ask:

Processing Location / Processing Mode

- In-House
- Job Work

If the user selects **In-House**, continue to the normal Production Run flow.

If the user selects **Job Work**, redirect the user into the dedicated Job Work creation workflow described later in this document.

4. IN-HOUSE PRODUCTION RUN – REVISED FLOW

For an In-House Production Run, the flow should be:

Step 1 – Select Plant / Location

Select where the production is happening.

Example:

- Bhramanwada
- Nedra
- Other applicable production location

Step 2 – Select Product

Select the product being processed.

Step 3 – Select Process Type

Available Process Types:

- Sortex
- Full Process

The available options must change according to the selected product.

5. FULL PROCESS PRODUCT RESTRICTION

At present, **only Sesame Seeds** are allowed to go through Full Process.

Therefore:

If selected product is a Sesame Seed product:

Allow:

- Sortex
- Full Process

If selected product is NOT Sesame Seeds:

Allow:

- Sortex only

Full Process should either:

- Not appear at all, or
- Appear disabled with a message such as:

“Full Process is currently available only for Sesame Seed products.”

This rule should be controlled through Product Master configuration instead of being permanently hard-coded wherever possible.

Recommended Product Master field:

Full Process Allowed: Yes / No

Initially, this should be enabled only for applicable Sesame Seed products.

6. RAW MATERIAL VISIBILITY WHILE CREATING A RUN

A Quality-of-Life improvement is required during Production Run creation.

Once the Production Location is selected, the system should immediately show the available Raw Material stock at that location.

Example:

Bhramanwada – Available Raw Material

Product	Available Quantity
Natural Sesame Seeds	18,500 KG
Hulled Sesame Seeds	4,200 KG
Amaranth Seeds	7,800 KG

Once the user selects a particular product, prominently show:

Available at Bhramanwada: 18,500 KG

If the requested production quantity exceeds available Raw Material, the Production Run must not be created.

7. DEFAULT UNIT ACROSS THE COMPLETE SYSTEM

The complete application should now use:

KG – Kilograms

as the default display unit.

Do not display MT as the default unit anywhere.

This applies to:

- Inventory
- Inward
- Production Runs
- Processed Inventory

- Fulfilment
- Wastage
- Sampling Rejection
- Plant Transfer
- Job Work
- Job Work Inward
- Job Work Outward
- Dashboard
- Reports
- Ledger

Example:

Instead of:

29 MT

Display:

29,000 KG

Backend quantities should preferably also be standardised in kilograms to avoid conversion and rounding issues.

If MT is required anywhere for reporting purposes later, it can be shown as an optional converted value.

8. REVISED SORTEX FLOW

A major correction is required in the current Sortex process.

Currently, even when the user selects Sortex, the system continues into Hulling and asks for Hulling wastage.

This is incorrect.

8.1 Correct Sortex Flow

The Sortex flow should be:

Input Material → Sortex/Cleaning → Type 2/3/4 Wastage → Final Output → Processed Inventory

There is **no Hulling stage in Sortex**.

There is **no Hulling WIP** in Sortex.

There are **no Hulling rejection/wastage fields** in Sortex.

8.2 Sortex Wastage

For Sortex, ask only:

- Type 2 Wastage
- Type 3 Wastage
- Type 4 Wastage

After these values are entered:

Total Sortex Wastage = Type 2 + Type 3 + Type 4

Net Processed Output = Total Input – Total Sortex Wastage

The run can then proceed directly to the Finalisation screen.

9. REVISED FULL PROCESS FLOW

Full Process should continue through both stages.

The flow should be:

**Input → Cleaning/Sortex → Type 2/3/4 Wastage → Hulling → Hulling Wastage/Rejections
→ Final Output → Processed Inventory**

Therefore Full Process contains:

Stage 1 – Cleaning / Sortex

- Type 2
- Type 3
- Type 4

Stage 2 – Hulling

All configured Hulling wastage/rejection types.

Stage 3 – Finalisation

- Calculate total wastage
 - Calculate net output
 - Decide which wastage types to Store or Discard
 - Move good output to Processed Inventory
-

10. REVISED PRODUCTION RUN FINAL PAGE

The current final page shows:

- Total Output
- Total Allocated
- Total Remaining

This is no longer relevant because fulfilment has been removed from the Production Run.

Remove:

- Total Allocated
- Allocation to Containers
- Remaining after Allocation
- Contract/Container selection

The revised Production Finalisation page should show:

Production Summary

- Production Number
 - Product
 - Plant
 - Process Type
 - Total Input
 - Total Wastage
 - Net Processed Output
 - Production Start Date
 - Production Completion Date
-

11. WASTAGE SUMMARY ON FINAL PRODUCTION PAGE

The final page should prominently display wastage.

11.1 Sortex Example

Total Wastage: 850 KG

On hover/click:

- Type 2: 300 KG
- Type 3: 350 KG
- Type 4: 200 KG

11.2 Full Process Example

Show:

Total Production Wastage: 2,450 KG

The breakdown should include:

Cleaning Wastage

- Type 2
- Type 3
- Type 4

Hulling Wastage

- Rejection 1
- Rejection 2
- All other configured Hulling wastage categories

The user should be able to hover/click Total Wastage to see exactly what contributes to the total.

12. WASTAGE DISPOSITION – STORE OR DISCARD

A major new functionality is required.

Every wastage category generated during production should allow the Production User to decide whether that wastage should be:

- Stored in Wastage Inventory
- Discarded

This should happen on the **Production Finalisation page**.

Example:

Wastage Type	Quantity	Action
Type 2	300 KG	Store / Discard
Type 3	350 KG	Store / Discard
Type 4	200 KG	Store / Discard

For Full Process, the same should be shown for all Hulling wastage/rejection types.

Example:

Wastage Type	Quantity	Action
Rejection 1	500 KG	Store / Discard
Rejection 2	300 KG	Store / Discard
Other Hulling Waste	150 KG	Store / Discard

The Production Run cannot be completely finalised until a disposition has been selected for every wastage type having quantity greater than zero.

13. WASTAGE INVENTORY

Wastage should no longer exist only as historical percentage/data against a Production Number.

It must now become an actual traceable inventory category.

For each wastage quantity stored in inventory, maintain:

- Wastage Lot Number
- Product
- Wastage Type
- Quantity
- Location
- Original Production Number
- Original Process Type
- Production Date
- Reprocessing Cycle
- Available Quantity
- Reprocessed Quantity
- Discarded Quantity
- Current Status

Example:

Product: Hulled Sesame Seeds

Wastage Type: Type 2

Production: PR-2026-0045

Stored Quantity: 300 KG

Available Quantity: 300 KG

14. IMPORTANT TERMINOLOGY – DO NOT MIX TWO TYPES OF “REJECTION”

There are two completely different concepts in the system.

A. Process Wastage / Hulling Rejection

Examples:

- Rejection 1
- Rejection 2
- Type 2
- Type 3

- Type 4
- Other Hulling wastage

These belong to:

Wastage Inventory

B. Sampling-Rejected Material

This means finished material that failed third-party sampling.

This belongs to:

Sampling-Rejected Inventory

These two categories must remain completely separate throughout:

- Inventory
 - Reports
 - Dashboard
 - Reprocessing
 - Ledger
 - Fulfilment
-

15. WASTAGE REPROCESSING

The business frequently reprocesses wastage to recover usable material that may have been incorrectly separated.

This can happen multiple times.

The system must support **at least two reprocessing cycles and should not technically limit the number of cycles.**

15.1 Reprocessing Method

Wastage should be reprocessed through:

Sortex

It should not directly go into Full Process.

The Sortex Production Run should allow an additional source category:

- Raw Material
- Wastage Inventory
- Sampling-Rejected Stock
- Eligible Processed Stock

When **Wastage Inventory** is selected, the user should select:

- Product
 - Wastage Type
 - Wastage Lot
 - Available Quantity
 - Quantity to Reprocess
-

16. WASTAGE REPROCESSING LINEAGE

The system must preserve complete traceability.

Example:

PR-001

produces

Type 2 Wastage – 500 KG

500 KG is stored in Wastage Inventory.

Later:

PR-015 – Sortex Reprocessing

uses:

400 KG Type 2 Wastage from PR-001

PR-015 produces:

- Good Processed Output: 300 KG
- Type 2 Wastage: 50 KG
- Type 3 Wastage: 30 KG
- Type 4 Wastage: 20 KG

If the user stores the new Type 2 and Type 3 wastage, they should become new wastage inventory quantities linked to:

- PR-015
- Parent Wastage Lot
- Original Production PR-001
- Reprocessing Cycle Number

Example:

Reprocessing Cycle: 2

This process should be repeatable again.

17. WASTAGE REPROCESSING INVENTORY EFFECT

When wastage is used for reprocessing:

The source Wastage Inventory should reduce.

Example:

Available Type 2 Wastage:

500 KG

Used in Sortex:

400 KG

Remaining:

100 KG

After production:

Good recovered material should move into:

Processed Inventory

New wastage should either:

- Return to Wastage Inventory, or
- Be discarded

according to the Production User's selection.

18. PRODUCTION FINALISATION

When the Production User clicks:

Finalise Production

the system should:

1. Validate all required production fields.
2. Validate all wastage fields.
3. Validate Store/Discard selection for every wastage quantity.
4. Calculate total wastage.
5. Calculate final processed output.
6. Store selected wastage in Wastage Inventory.
7. Mark discarded wastage as Discarded.
8. Reduce/close Work in Progress.
9. Add the final good output to Processed Inventory.
10. Mark the Production Run as Completed.
11. Create all Inventory Ledger transactions.

At this stage, **no contract allocation should occur.**

19. PROCESSED INVENTORY

All successfully produced material must first enter Processed Inventory.

Each processed stock record must retain:

- Product
- Quantity
- Available Quantity
- Reserved Quantity
- Location

- Production Number
- Process Type
- Production Source
- Production Date
- Reprocessing Source, if applicable
- Job Work Reference, if applicable
- Sampling-Rejected Source, if applicable
- Wastage Reprocessing Source, if applicable

Production Source

Recommended values:

- In-House Production
- Job Work
- Wastage Reprocessing
- Sampling-Rejected Reprocessing

These can help generate Dashboard analytics later.

20. REVISED FULFILMENT TAB

The current Fulfilment screen should be redesigned.

The user should **not first select a Production Batch/Output Batch**.

Instead, fulfilment should start from:

Processed Inventory

Recommended flow:

Select Product → Select/Confirm Location → View Available Processed Stock → View Matching Contracts → Allocate Stock

21. PRODUCT-BASED CONTRACT FILTERING

This is a strict business rule.

If the selected processed product is:

Hulled Sesame Seeds

the user must only see contracts/containers containing:

Hulled Sesame Seeds

The user must not be able to fulfil:

- Amaranth Seeds
- Natural Sesame Seeds
- Any other product

using Hulled Sesame Seed inventory.

Similarly, Amaranth processed stock can fulfil only Amaranth requirements.

Matching should happen using:

Product ID

and not merely similar product names.

Unless an explicit product-mapping rule is configured later, only an **exact Product ID match** should be allowed.

22. QUALITY-OF-LIFE CONTRACT FILTERING

Once a product is selected in Fulfilment, automatically hide every contract/container that does not require that product.

Example:

Selected Processed Product:

Hulled Sesame Seeds

Show only:

- Contract A – Hulled Sesame Seeds required
- Contract D – Hulled Sesame Seeds required
- Contract F – Hulled Sesame Seeds required

Do not show unrelated contracts at all.

This keeps the screen simple and prevents incorrect allocation.

23. CORRECT AVAILABLE QUANTITY IN FULFILMENT

There is currently a mismatch where the screen displays one available quantity, but allocation validation uses another quantity.

Example:

Screen shows:

29,000 KG Available

but when allocating, the system may return an error saying:

Only X KG is available.

This must be corrected.

There should be **one authoritative quantity calculation** used by:

- Processed Inventory
- Fulfilment UI
- Fulfilment validation
- Ledger
- Contract allocation

Recommended formula:

Available Processed Quantity = Total Processed Quantity – Quantity Already Reserved/Allocated – Quantity Already Consumed/Dispatched

The same backend-calculated value must be displayed and validated.

Do not calculate the UI quantity separately from the backend allocation quantity.

24. FULFILMENT SCREEN STRUCTURE

Recommended screen:

Section 1 – Product Selection

Product:

Hulled Sesame Seeds

Section 2 – Processed Stock

Available Processed Stock: 29,000 KG

If multiple locations contain stock, display:

- Bhramanwada: 18,000 KG
- Nedra: 7,000 KG
- In-House/Godown: 4,000 KG

If allocation requires a physical source location, the user must select the location before confirming the allocation.

Section 3 – Matching Contracts

Only contracts requiring the selected product should appear.

Section 4 – Matching Containers

Display:

- Contract Number
- Container Number
- Buyer
- Country
- EU/Non-EU
- Required Product
- Required Quantity
- Already Fulfilled
- Pending Quantity
- Due Date

Section 5 – Allocation

Allow the user to enter quantity to fulfil.

25. BATCH / LOT HANDLING IN FULFILMENT

The user should not be forced to manually select Output Batch/Production Number before fulfilling a contract.

However, backend traceability must still be maintained.

Therefore:

- User selects Processed Product
- User selects source location where necessary
- System identifies eligible processed lots
- System deducts quantities from eligible lots
- Allocation keeps references to the Production Numbers/lots consumed

Recommended backend allocation method:

FIFO – Oldest eligible processed stock first

If one container requires 5,000 KG and the stock comes from:

- PR-001: 3,000 KG
- PR-002: 2,000 KG

the user can simply allocate:

5,000 KG

Backend should retain that:

- 3,000 KG came from PR-001
- 2,000 KG came from PR-002

The user does not need to manually perform this split.

26. FULFILMENT VALIDATION

The system must prevent:

- Product mismatch
- Allocation above Processed Inventory
- Allocation above container pending quantity
- Allocation from another physical location without transfer
- Allocation of Wastage Inventory
- Allocation of Sampling-Rejected Inventory
- Allocation from uncompleted production
- Allocation from discarded stock

Example:

Container requires:

10,000 KG Hulled Sesame Seeds

Available:

8,000 KG

Maximum allocation allowed:

8,000 KG

Container status becomes:

Partially Fulfilled

Remaining:

2,000 KG

27. EU + RUSSIA SAMPLING RULE

The previous system automatically sends EU containers to Sampling after fulfilment.

This logic must now be extended.

A fulfilled container must go to Sampling when:

Condition 1

Container/Contract is EU

OR

Condition 2

Destination Country is Russia

Therefore:

Requires Sampling = EU = Yes OR Country = Russia

Russia must require Sampling even when that contract is marked Non-EU.

28. SAMPLING EXAMPLES

EU + Germany

Fully Fulfilled → Sampling Required

Non-EU + UAE

Fully Fulfilled → Ready for Dispatch

Non-EU + Russia

Fully Fulfilled → Sampling Required

EU + Russia

Fully Fulfilled → Sampling Required

The system should create only one sampling requirement even if both rules are true.

29. REVISED INVENTORY ARCHITECTURE

At any point, the system should be able to answer:

“If we have 100,000 KG of this product, what exactly makes up those 100,000 KG?”

The system should distinguish:

- Raw Material
- Work in Progress
- Processed Stock
- Wastage Inventory
- Sampling-Rejected Stock
- Reserved Processed Stock
- Stock in Transit, where applicable

And should also distinguish physical location.

30. INVENTORY LOCATIONS

Current Receiving Locations should now contain four options:

1. In-House / Godown
2. Bhramanwada
3. Nedra
4. Outside Warehouse

Therefore, when clicking:

New Inward

the **Receiving Location** field must show all four options.

“Outside Warehouse” should also be available wherever inventory location is relevant.

31. INVENTORY DEFAULT SCREEN – COMPLETE REDESIGN

The current Inventory screen is too cluttered because separate rows are being displayed for:

- Raw Material
- Processed Available
- Wastage
- Rejected
- etc.

This should be changed.

The default Inventory screen should show **one row/card per Product**.

Example:

Product	Total Tracked Stock
Natural Sesame Seeds	125,400 KG
Hulled Sesame Seeds	78,250 KG
Amaranth Seeds	34,500 KG

This should be the clean default view.

32. INVENTORY TOTAL CALCULATION

The displayed Product Total should be generated from all physically tracked stock categories.

For example:

Total Tracked Stock = Raw Material + WIP + Processed Stock + Wastage Stock + Sampling-Rejected Stock

Reserved Processed Stock must not be double-counted if it is already part of Processed Stock.

Stock in Transit must also not be double-counted at both source and destination.

For company-wide overview, Stock in Transit may be included in Company Total but should be separately identified.

Discarded stock must never contribute to Inventory Total.

33. INVENTORY HOVER SUMMARY

When the user hovers over the Product Total, show a quick breakdown.

Example:

Hulled Sesame Seeds – 78,250 KG

- Raw Material: 20,000 KG
- Processed: 41,000 KG
- Wastage: 7,250 KG
- Sampling-Rejected: 5,000 KG
- Work in Progress: 5,000 KG

This should be a lightweight quick summary.

34. INVENTORY PRODUCT DETAIL SCREEN

When the user clicks a Product or its Total, open a detailed Inventory view.

The top of the page should first show a table.

Example:

Location	Raw	WIP	Processed	Wastage	Sampling Rejected	Total
In-House	8,000	0	12,000	1,000	0	21,000 KG
Bhramanwada	7,000	3,000	20,000	4,000	3,000	37,000 KG
Nedra	5,000	2,000	9,000	2,250	2,000	20,250 KG
Total	20,000	5,000	41,000	7,250	5,000	78,250 KG

35. WASTAGE DETAIL INSIDE INVENTORY

The Wastage number should itself be expandable/hoverable.

Example:

Wastage: 7,250 KG

Hover/click should show:

- Type 2: 2,000 KG
- Type 3: 1,500 KG
- Type 4: 900 KG
- Rejection 1: 1,200 KG
- Rejection 2: 750 KG
- Other Wastage: 900 KG

The system must be able to provide this because every wastage inventory entry is being stored with its Wastage Type.

36. INVENTORY GRAPHS AND VISUALISATIONS

The detailed Product Inventory page should use the available data to provide an attractive graphical representation.

Recommended visualisations:

Stock Composition – Donut / Pie / Sunburst

Show:

- Raw Material
- Processed
- WIP
- Wastage
- Sampling-Rejected

Location Distribution

Show how total stock is distributed among:

- In-House
- Bhramanwada
- Nedra
- Outside Warehouse

Wastage Composition

Show:

- Type 2
- Type 3
- Type 4
- Rejection 1
- Rejection 2
- Other categories

Inventory Movement

Where sufficient historical ledger information exists, show:

- Inward
- Production Consumption
- Production Output
- Fulfilment
- Transfers
- Wastage additions
- Reprocessing

over a selected date period.

Graphs should improve understanding rather than make the page crowded.

37. INVENTORY LOCATION FILTER

The Inventory screen should support location filtering.

Example:

Location = In-House / Godown

The screen structure should remain exactly the same:

Product	Total
Natural Sesame	25,000 KG
Hulled Sesame	16,000 KG
Amaranth	8,500 KG

But all calculations should now contain only stock located at In-House/Godown.

Hover should show the category breakdown for that location.

Click should open the same detailed view, already filtered to the selected location.

This same behaviour should apply to:

- All Locations
- In-House
- Bhramanwada
- Nedra
- Outside Warehouse

38. INVENTORY FILTERS

Recommended filters:

- Location
- Product
- Stock Category
- Search
- Date / Snapshot Date where supported

Default:

All Locations + All Products

39. RECENT INVENTORY LEDGER FIX

The current Recent Ledger is not properly showing quantity information.

This must be corrected.

Every ledger row should clearly show:

- Date & Time
- Product
- Transaction Type
- Reference Number
- Location
- Quantity In
- Quantity Out
- Balance After Transaction
- User
- Remarks

Example:

Transaction	Product	Qty In	Qty Out	Balance
Raw Material Inward	Sesame	+2,000 KG	—	12,000 KG
Production Issue	Sesame	—	-3,000 KG	9,000 KG
Processed Output	Hulled Sesame	+2,650 KG	—	6,250 KG

Every quantity in the Ledger should default to KG.

40. WASTAGE INVENTORY DEDICATED SECTION

Inventory should contain a dedicated:

Wastage Inventory

section.

The user should be able to see:

- Product
- Wastage Type
- Total Available Wastage
- Location
- Source Production Runs
- Reprocessing Cycle
- Available for Reprocessing
- Already Reprocessed
- Discarded Quantity

Available actions:

- Start Sortex
 - View Source
 - View History
 - Transfer, if permitted
 - Discard remaining stock with permission/reason
-

41. START SORTEX FROM WASTAGE INVENTORY

From Wastage Inventory, provide:

Start Sortex

When clicked:

- Product should auto-populate
- Source should be Wastage Inventory
- Wastage Type/Lot should be linked
- Available quantity should be shown
- User selects quantity
- Location should be validated
- New Production Number should be created

The complete lineage must remain traceable.

42. JOB WORK MODULE – OVERVIEW

A completely new Job Work workflow is required.

Job Work means material is sent outside the company's plant for processing and later returned.

There may be:

- Multiple outward shipments
- Multiple inward/return receipts
- Additional material sent after processing begins
- Partial processed material returned
- Wastage returned separately
- Certain wastage discarded by the Job Worker

Therefore, every Job Work operation must have a unique Job Work Number.

43. JOB WORK NUMBER

Recommended format:

JW-YYYY-00001

This number should represent one complete Job Work processing cycle.

All outward and inward entries should remain linked to this Job Work Number.

44. JOB WORK TAB

Create a dedicated main navigation tab:

Job Work

The default Job Work page should show:

- Job Work Number
- Job Worker / Party
- Product
- Process
- Source Location
- Total Sent
- Total Received
- Processed Material Received
- Wastage Returned
- Quantity Still Outside
- Start Date
- Current Status

Filters:

- Active
 - Closed
 - Product
 - Process
 - Job Worker
 - Source Location
 - Date Range
-

45. JOB WORK CREATION

When creating a Job Work record, ask:

Job Work Details

- Job Work Number – Auto-generated
- Job Worker / Party
- Source Factory / Location
- Product
- Process Type
- Start Date
- Remarks

Source Location may be:

- In-House/Godown
- Bhramanwada
- Nedra

- Outside Warehouse, if applicable
-

46. JOB WORK PROCESS VALIDATION

The same process rule applies to Job Work.

Sesame Seed Product

Allow:

- Sortex
- Full Process

Other Products

Allow:

- Sortex only
-

47. JOB WORK OUTWARD

Inside every Job Work record there should be:

Outward Entries

Every time material is sent to the Job Worker, create a separate Outward entry.

Example:

Job Work:

JW-001

First Outward:

500 KG

Second Outward:

500 KG

Total Sent:

1,000 KG

Do not overwrite the first outward entry.

48. JOB WORK OUTWARD FIELDS

Recommended fields:

- Outward Number – Auto-generated
- Job Work Number
- Date
- Source Location
- Product
- Quantity
- Number of Bags, where applicable
- Truck / Vehicle Number
- Challan Number, where applicable
- Remarks
- Created By
- Created Date & Time

When Outward is confirmed:

- Reduce available inventory from the source location
- Increase the operational quantity marked as **Material with Job Worker**
- Do not count it as available stock at the source location

This “Material with Job Worker” quantity should primarily be tracked inside the Job Work module rather than creating a normal Processed Inventory category.

49. ADD MORE MATERIAL TO ACTIVE JOB WORK

An active Job Work should contain:

Add More Material

This creates another Job Work Outward entry.

Example:

Originally sent:

500 KG

Later sent:

500 KG

Total Job Work Material Sent:

1,000 KG

Each outward remains independently traceable.

50. JOB WORK INWARD / RETURN RECEIPTS

Material may return from the Job Worker in several separate deliveries.

Example:

Sent:

1,000 KG

Return 1:

200 KG

Return 2:

300 KG

Return 3:

250 KG

Return 4:

150 KG

Return 5:

100 KG

Therefore, every receipt must be entered separately.

Inside the Job Work record create:

Inward / Return Entries

Do not combine all receipts into one entry.

51. JOB WORK RETURN ENTRY FIELDS

Each Job Work return entry should contain:

- Job Work Inward Number
 - Job Work Number
 - Receipt Date
 - Receiving Location
 - Product
 - Return Category
 - Wastage Type, when applicable
 - Quantity
 - Number of Bags, where applicable
 - Truck / Vehicle Number
 - Challan Number, where applicable
 - Remarks
 - Received By
 - Created Date & Time
-

52. JOB WORK RETURN CATEGORIES

A Job Work return can contain different material categories.

Possible categories:

- Processed Material
- Unprocessed Material Return, if applicable
- Type 2 Wastage
- Type 3 Wastage
- Type 4 Wastage
- Hulling Rejection/Wastage
- Other configured Wastage

One vehicle/receipt may contain multiple rows.

Example:

Job Work Receipt JW-IN-004

- Processed Hulled Sesame: 700 KG
- Type 2: 80 KG
- Type 3: 40 KG

Each component must be stored separately.

53. JOB WORK PROCESS RESULT

Before a Job Work can be closed, the Job Worker's production result must be entered.

This is essential because simply tracking what was sent and what returned will not provide accurate production and wastage information.

The Job Work result should ask for the same processing data as an In-House Run.

54. JOB WORK SORTEX RESULT

For Sortex Job Work, collect:

- Total Quantity Processed
- Type 2 Wastage
- Type 3 Wastage
- Type 4 Wastage

- Net Processed Output

Calculation:

Net Processed Output = Processed Input – Type 2 – Type 3 – Type 4

55. JOB WORK FULL PROCESS RESULT

For Full Process Job Work, collect:

Cleaning Wastage

- Type 2
- Type 3
- Type 4

Hulling Wastage

- All configured Hulling wastage/rejection categories

Then calculate:

- Total Wastage
- Net Processed Output
- Wastage Percentage

The same >12% wastage alert logic should apply if applicable to the relevant Full Process wastage calculation.

56. JOB WORK WASTAGE DISPOSITION

The Job Worker may tell the company:

- Processed material is being returned
- Type 2 is being returned
- Type 3 is being returned
- Type 4 was discarded
- Certain Hulling wastage was discarded

Therefore, every Job Work wastage category should contain a disposition.

Recommended:

- Returned by Job Worker
- Discarded at Job Worker

Example:

Wastage	Total Produced	Disposition
Type 2	80 KG	Returned
Type 3	40 KG	Returned
Type 4	20 KG	Discarded

If Returned is selected, the cumulative Job Work inward records must eventually account for that quantity.

If Discarded is selected, it should not be added to Inventory.

57. JOB WORK RECONCILIATION

Each Job Work needs a reconciliation section.

Show:

Material Movement

- Total Material Sent
- Total Quantity Processed
- Processed Output Expected
- Processed Output Received
- Wastage Expected to Return
- Wastage Actually Received
- Wastage Discarded
- Unprocessed Material Returned
- Quantity Still Pending
- Reconciliation Difference

The system should clearly flag any unexplained difference.

58. JOB WORK CLOSURE VALIDATION

The user must not be allowed to close a Job Work simply because some material has returned.

Before enabling:

Close Job Work

the system must validate:

- Required process result has been entered
- Total processed quantity has been entered
- All required wastage quantities have been entered
- Wastage disposition has been selected
- Expected processed material has been accounted for
- Expected returned wastage has been accounted for
- All relevant inward/return entries are complete
- Remaining quantity with Job Worker is zero, unless an Admin-authorized variance is entered

If there is a variance, clearly show:

Unreconciled Difference: X KG

Normal Production Users should not be able to silently close this.

59. JOB WORK STATUSES

Recommended statuses:

- Draft
- Active
- Material Partially Sent
- Material Sent
- Processing
- Partially Received

- Awaiting Remaining Material
- Awaiting Reconciliation
- Ready to Close
- Closed
- Cancelled

The status should be derived automatically wherever possible.

60. JOB WORK INVENTORY HANDLING

Do not create a permanently separate “Job Work Processed Inventory” category.

Instead:

While material is outside:

Track it operationally as:

Material with Job Worker

against the Job Work Number.

When processed material returns:

Add it to normal:

Processed Inventory

at the Receiving Location.

However, preserve metadata:

Production Source = Job Work

and:

Job Work Number = JW-XXXX

This allows Dashboard reporting without creating a separate permanent stock category.

61. JOB WORK RETURNED WASTAGE

Returned Job Work wastage should be handled similarly to In-House wastage.

If it has physically returned and is intended to be kept:

Add it to:

Wastage Inventory

Maintain:

- Product
- Wastage Type
- Job Work Number
- Job Worker
- Quantity
- Location
- Receipt Number

If the Job Worker discarded it:

Do not add it to inventory.

Record it only as:

Disposed/Discarded at Job Worker

for historical reconciliation.

62. JOB WORK PROCESSED MATERIAL – MULTIPLE INWARD AGGREGATION

The Job Work system must distinguish between:

Individual Receipt Records

Example:

- Receipt 1: 200 KG

- Receipt 2: 300 KG
- Receipt 3: 500 KG

and:

Total Processed Material Received

1,000 KG

This total should be calculated automatically across all Processed Material return entries belonging to the same Job Work Number.

63. RE-SORTEX OF JOB WORK RETURNED MATERIAL

After the processed material has returned from Job Work, the company may want to run the entire returned output through Sortex again internally.

Provide a button:

Start Re-Sortex

This should operate on the **aggregate available Job Work processed output**, not require the user to individually select each Job Work inward receipt.

Example:

JW-001 processed receipts:

- 200 KG
- 300 KG
- 500 KG

Total returned processed material:

1,000 KG

The user should be able to click:

Start Re-Sortex – 1,000 KG Available

64. RE-SORTEX FROM JOB WORK – SYSTEM BEHAVIOUR

When Start Re-Sortex is clicked:

- Create a new In-House Sortex Production Run
- Preserve the originating Job Work Number
- Product should auto-populate
- Source Category should be Job Work Returned Processed Material
- Show total currently available Job Work processed quantity
- Allow user to select quantity
- Validate receiving/current location
- Move selected quantity from Processed Inventory into Sortex WIP
- Follow normal Sortex logic
- Store resulting good output back into Processed Inventory
- Store/discard resulting Type 2/3/4 wastage normally

All source Job Work receipt references should remain available in the backend history.

65. JOB WORK RE-SORTEX BUTTON AVAILABILITY

The button should only be enabled when:

- Processed Job Work material has been received
- The received material is currently available
- It has not already been completely consumed/fulfilled/reprocessed

Preferably show:

Processed Received: 1,000 KG
Available for Re-Sortex: 750 KG

rather than simply using historical received quantity.

66. JOB WORK DASHBOARD

Add Job Work information to the Owner Dashboard.

Recommended cards:

Active Job Works

Number of currently active Job Work records.

Material Currently at Job Workers

Total KG currently outside and not yet returned.

Job Work Processed This Month

Total processed output generated through Job Work during the selected month.

Job Work Material Received

Total processed material received back.

Job Work Pending Return

Quantity expected but not yet received.

The Owner should be able to click these cards to open the corresponding Job Work records.

67. PRODUCTION SOURCE ANALYTICS

The Owner should be able to understand how production is being performed.

For selected period show:

- In-House Processed Quantity
- Job Work Processed Quantity
- Wastage-Reprocessing Recovery
- Sampling-Rejected Reprocessing Recovery

Example:

Total Processed This Month: 125,000 KG

- In-House: 90,000 KG
- Job Work: 30,000 KG
- Reprocessing Recovery: 5,000 KG

This information should come from Production Source metadata.

68. REVISED INVENTORY CATEGORIES

For clarity, the inventory architecture should now contain:

1. Raw Material

Unprocessed normal stock.

2. Work in Progress

In-House material currently inside an active Production Run.

Possible subcategories:

- Sortex/Cleaning WIP
- Hulling WIP

3. Processed Inventory

Finished usable product available for fulfilment.

4. Reserved Processed Inventory

Processed material already allocated but not yet dispatched.

This should be treated as a subset/state of Processed Inventory and should not be double-counted.

5. Wastage Inventory

Process wastage intentionally retained for possible reprocessing.

This must have Wastage Type.

6. Sampling-Rejected Inventory

Finished material that failed Sampling.

7. Stock in Transit

Material moving between company locations.

8. Material with Job Worker

Operational quantity currently outside for Job Work.

This may be displayed separately from normal location inventory so it does not confuse physical stock available for use.

69. INVENTORY TRACEABILITY

For every quantity in the system, the application should be capable of tracing its origin.

Examples:

Raw Material

Inward → Party → Location

Processed Material

Production Run → Input → Process → Location

Wastage

Production Run → Product → Wastage Type → Reprocessing Cycle

Sampling-Rejected

Container → Sample → Production Source

Job Work Output

Job Work → Individual Return Entries → Processed Inventory

Reprocessed Wastage Output

Original Production → Wastage Lot → Reprocessing Production → New Processed Output

This lineage should remain available even when the normal UI shows only a simplified inventory total.

70. DASHBOARD ADDITIONS

In addition to the existing Owner Dashboard requirements, add:

- Total Wastage Inventory
- Wastage by Type
- Wastage awaiting Reprocessing
- Reprocessing Recovery
- Active Job Works
- Material currently with Job Workers
- Job Work Processed Quantity
- Job Work Pending Return
- Processed Inventory available for Fulfilment
- Sampling required for EU
- Sampling required for Russia
- High Wastage Alerts

Charts should be used where they improve visibility.

71. MIGRATION / EXISTING DATA HANDLING

Because Fulfilment is being removed from the Production Run flow, existing records must not be broken.

Existing historical Production Runs

Keep historical container allocations visible as read-only history.

New Production Runs

Do not allow allocation from the Run page.

Existing completed runs with unallocated output

Ensure their currently available output exists correctly inside Processed Inventory.

Existing Processed Inventory

Recalculate available quantities before activating the revised Fulfilment flow so that the UI and backend use the same balance.

72. REVISED HIGH-LEVEL WORKFLOWS

A. Normal In-House Sortex

Raw Material → Production Run → Type 2/3/4 Wastage → Wastage Store/Discard → Processed Inventory → Fulfilment → Sampling if EU/Russia → Dispatch

B. Normal In-House Full Process

Raw Material → Cleaning → Type 2/3/4 Wastage → Hulling → Hulling Wastage → Wastage Store/Discard → Processed Inventory → Fulfilment → Sampling if EU/Russia → Dispatch

C. Wastage Reprocessing

Wastage Inventory → Sortex → Recovered Processed Output → Processed Inventory + New Wastage → Store/Discard → Can Repeat

D. Sampling-Rejected Reprocessing

Sampling-Rejected Inventory → Sortex → Processed Inventory → Future Fulfilment → Sampling rules apply again

E. Job Work

Company Inventory → Job Work Outward(s) → Material with Job Worker → External Processing → Job Work Return(s) → Processed Inventory + Returned Wastage → Reconciliation → Close Job Work

F. Job Work Re-Sortex

Job Work Returned Processed Inventory → Start Re-Sortex → In-House Sortex → New Processed Output + Wastage

73. FINAL ACCEPTANCE CHECKLIST

A. Production Run Architecture

- ☐ Production and Fulfilment are separate modules.
 - ☐ Production Run no longer contains Contract/Container allocation.
 - ☐ Final Production output always enters Processed Inventory first.
 - ☐ Production Run starts by distinguishing In-House vs Job Work.
 - ☐ Selecting Job Work routes the user into the Job Work workflow.
-

B. Product and Process Rules

- ☐ Product is selected during New Run creation.
 - ☐ Sortex is available for eligible products.
 - ☐ Full Process is available only for Sesame Seed products.
 - ☐ Non-Sesame products cannot select Full Process.
 - ☐ Product Master supports Full Process Allowed configuration.
 - ☐ Exact Product IDs are used for inventory and fulfilment matching.
-

C. Raw Material Visibility

- ☐ Location is selected before Production quantity.

- ☐ Raw stock available at the selected location is displayed.
 - ☐ Selected product's available stock is prominently displayed.
 - ☐ Production quantity above available stock is blocked.
 - ☐ Stock shown to the user matches backend stock validation.
-

D. Sortex Flow

- ☐ Sortex does not enter Hulling.
 - ☐ Sortex does not create Hulling WIP.
 - ☐ Sortex asks only for Type 2, Type 3 and Type 4 wastage.
 - ☐ Sortex calculates Total Wastage.
 - ☐ Sortex calculates Net Processed Output.
 - ☐ Sortex proceeds directly to Production Finalisation.
-

E. Full Process Flow

- ☐ Full Process contains Cleaning.
 - ☐ Cleaning contains Type 2/3/4 wastage.
 - ☐ Full Process continues into Hulling.
 - ☐ Hulling contains configured rejection/wastage types.
 - ☐ Total Full Process wastage is calculated correctly.
 - ☐ Net Processed Output is calculated correctly.
-

F. Production Final Page

- ☐ Total Allocated has been removed.

- ☐ Container allocation has been removed.
 - ☐ Total Remaining after allocation has been removed.
 - ☐ Total Input is displayed.
 - ☐ Total Wastage is displayed.
 - ☐ Net Processed Output is displayed.
 - ☐ Wastage breakdown is available on hover/click.
 - ☐ Every non-zero wastage category contains Store/Discard controls.
 - ☐ Production cannot finalise until each wastage category has a disposition.
-

G. Processed Inventory

- ☐ Every completed Production Run adds good output to Processed Inventory.
 - ☐ Product is stored correctly.
 - ☐ Location is stored correctly.
 - ☐ Production Number is preserved.
 - ☐ Process Type is preserved.
 - ☐ Production Source is preserved.
 - ☐ Available and Reserved quantities are separately tracked.
-

H. Fulfilment Redesign

- ☐ Fulfilment no longer starts by selecting a Production Batch.
- ☐ User selects a Processed Inventory product.
- ☐ Available Processed Stock is displayed.
- ☐ Location-wise available stock is displayed where relevant.

- ☐ Only matching contracts are shown.
 - ☐ Only matching containers are shown.
 - ☐ Product mismatch fulfilment is impossible.
 - ☐ Hulled Sesame cannot fulfil Amaranth.
 - ☐ Amaranth cannot fulfil Sesame.
 - ☐ Exact Product ID is used for validation.
 - ☐ Partial fulfilment remains supported.
 - ☐ Backend preserves consumed Production Lot references.
 - ☐ User does not need to manually split allocation across Production Lots.
-

I. Fulfilment Quantity Bug

- ☐ One backend calculation determines available processed quantity.
 - ☐ Inventory screen uses that calculation.
 - ☐ Fulfilment screen uses that calculation.
 - ☐ Fulfilment validation uses that calculation.
 - ☐ Displayed quantity and allocatable quantity can no longer differ.
 - ☐ Reserved quantity is properly deducted.
 - ☐ Already consumed/dispatched quantity is properly deducted.
-

J. Sampling

- ☐ EU contracts require Sampling after full fulfilment.
- ☐ Russia contracts require Sampling after full fulfilment.
- ☐ Non-EU Russia contracts still require Sampling.

- ☐ EU Russia contracts generate only one Sampling workflow.
 - ☐ Other Non-EU countries continue directly to Ready for Dispatch unless manually configured otherwise.
-

K. Wastage Inventory

- ☐ Wastage is stored as actual inventory and not only historical percentage.
 - ☐ Product is stored with each wastage entry.
 - ☐ Wastage Type is stored.
 - ☐ Quantity is stored.
 - ☐ Location is stored.
 - ☐ Production Number is stored.
 - ☐ Reprocessing cycle is stored.
 - ☐ Available wastage quantity is tracked.
 - ☐ Stored wastage increases Wastage Inventory.
 - ☐ Discarded wastage does not enter Inventory.
-

L. Wastage Store/Discard

- ☐ Type 2 can independently be stored/discarded.
 - ☐ Type 3 can independently be stored/discarded.
 - ☐ Type 4 can independently be stored/discarded.
 - ☐ Hulling rejection/wastage categories can independently be stored/discarded.
 - ☐ Disposition is preserved historically.
 - ☐ Discarded quantities never appear as available stock.
-

M. Wastage Reprocessing

- ☐ Wastage Inventory can be selected as a Sortex source.
 - ☐ Available wastage quantity is validated.
 - ☐ Used wastage stock reduces from inventory.
 - ☐ Reprocessing creates a new Production Number.
 - ☐ Parent Wastage Lot is preserved.
 - ☐ Original Production lineage is preserved.
 - ☐ Reprocessing cycle is preserved.
 - ☐ Recovered good material enters Processed Inventory.
 - ☐ New wastage may again be stored or discarded.
 - ☐ More than two reprocessing cycles are technically supported.
-

N. Rejection Separation

- ☐ Process Rejection/Wastage remains under Wastage Inventory.
 - ☐ Sampling-Rejected Material remains under Sampling-Rejected Inventory.
 - ☐ The two are never combined.
 - ☐ Both remain independently reportable.
 - ☐ Sampling-Rejected stock continues to follow its dedicated reprocessing rules.
-

O. Inventory Default View

- ☐ Inventory default screen shows one row/card per Product.
- ☐ Product Total is prominently displayed.
- ☐ Raw/Processed/Wastage records are not shown as cluttered independent rows by default.

- ☐ Hovering Product Total shows category breakdown.
 - ☐ Clicking Product opens detailed Inventory analysis.
-

P. Inventory Detail Page

- ☐ Location-wise table is shown first.
 - ☐ Raw Material quantity is shown.
 - ☐ WIP quantity is shown.
 - ☐ Processed quantity is shown.
 - ☐ Wastage quantity is shown.
 - ☐ Sampling-Rejected quantity is shown.
 - ☐ Total is shown.
 - ☐ Wastage can be further expanded by Wastage Type.
 - ☐ Values are displayed in KG.
-

Q. Inventory Graphs

- ☐ Product composition chart is available.
 - ☐ Location distribution chart is available.
 - ☐ Wastage composition chart is available.
 - ☐ Historical inventory movement chart is available where data permits.
 - ☐ Charts use the same quantities as Inventory tables.
 - ☐ Charts do not introduce separate calculation logic.
-

R. Inventory Location Filters

- ☐ All Locations filter works.
 - ☐ In-House/Godown filter works.
 - ☐ Bhramanwada filter works.
 - ☐ Nedra filter works.
 - ☐ Outside Warehouse filter works.
 - ☐ Product totals change according to location filter.
 - ☐ Hover summaries follow the current location filter.
 - ☐ Detail pages follow the current location filter.
-

S. Receiving Location

- ☐ New Inward includes In-House/Godown.
 - ☐ New Inward includes Bhramanwada.
 - ☐ New Inward includes Nedra.
 - ☐ New Inward includes Outside Warehouse.
 - ☐ Inventory can track stock at all four locations.
-

T. KG Unit Standardisation

- ☐ Inventory defaults to KG.
- ☐ Production defaults to KG.
- ☐ Fulfilment defaults to KG.
- ☐ Wastage defaults to KG.
- ☐ Inward defaults to KG.
- ☐ Plant Transfer defaults to KG.

- ☐ Job Work defaults to KG.
 - ☐ Dashboard defaults to KG.
 - ☐ Reports default to KG.
 - ☐ Ledger defaults to KG.
-

U. Recent Ledger

- ☐ Quantity In is visible.
 - ☐ Quantity Out is visible.
 - ☐ Balance after transaction is visible.
 - ☐ Product is visible.
 - ☐ Transaction type is visible.
 - ☐ Reference number is visible.
 - ☐ Location is visible.
 - ☐ User is visible.
 - ☐ All quantities display in KG.
-

V. Job Work Creation

- ☐ Dedicated Job Work page exists.
- ☐ Every Job Work receives a unique Job Work Number.
- ☐ Job Worker/Party is stored.
- ☐ Source Factory/Location is stored.
- ☐ Product is stored.
- ☐ Process Type is stored.

- ☐ Full Process restrictions apply to Job Work.
 - ☐ Job Work status is visible.
-

W. Job Work Outward

- ☐ Multiple Outward entries can exist under one Job Work.
 - ☐ Each Outward retains its own number.
 - ☐ Date is stored.
 - ☐ Quantity is stored.
 - ☐ Product is stored.
 - ☐ Source Location is stored.
 - ☐ Truck/Vehicle information can be stored.
 - ☐ Challan information can be stored.
 - ☐ Sending additional material does not overwrite previous Outward entries.
 - ☐ Source inventory reduces correctly.
 - ☐ Material currently with Job Worker is tracked.
-

X. Job Work Inward / Returns

- ☐ Multiple Inward/Return entries can exist under one Job Work.
- ☐ Each receipt retains its own number.
- ☐ Processed material can be recorded.
- ☐ Returned Type 2 can be recorded.
- ☐ Returned Type 3 can be recorded.
- ☐ Returned Type 4 can be recorded.

- ☐ Hulling wastage returns can be recorded.
 - ☐ Multiple categories can exist within a receipt.
 - ☐ Individual receipts remain visible.
 - ☐ Cumulative totals are automatically calculated.
-

Y. Job Work Process Result

- ☐ Sortex Job Work asks for Type 2/3/4 quantities.
 - ☐ Full Process Job Work asks for Cleaning and Hulling wastage.
 - ☐ Total Processed Input is stored.
 - ☐ Net Processed Output is calculated.
 - ☐ Total Wastage is calculated.
 - ☐ Wastage Percentage is calculated where applicable.
 - ☐ Required production information must be entered before closure.
-

Z. Job Work Wastage

- ☐ Every Job Work wastage type has a disposition.
 - ☐ Returned wastage can enter Wastage Inventory.
 - ☐ Wastage discarded by Job Worker does not enter Inventory.
 - ☐ Returned quantity is reconciled against expected returned quantity.
 - ☐ Job Work Number remains linked with returned wastage.
-

AA. Job Work Reconciliation

- ☐ Total Sent is displayed.

- ☐ Total Processed is displayed.
 - ☐ Processed Output Expected is displayed.
 - ☐ Processed Output Received is displayed.
 - ☐ Wastage Expected is displayed.
 - ☐ Wastage Received is displayed.
 - ☐ Wastage Discarded is displayed.
 - ☐ Material Still Outside is displayed.
 - ☐ Reconciliation Difference is displayed.
 - ☐ Unexplained differences are flagged.
-

AB. Job Work Closure

- ☐ Job Work cannot close without process results.
 - ☐ Job Work cannot close without wastage details.
 - ☐ Job Work cannot close without disposition of wastage.
 - ☐ Required return receipts must be accounted for.
 - ☐ Outstanding Material with Job Worker must normally be zero.
 - ☐ Admin-authorized variance requires a reason.
 - ☐ Closed Job Work becomes read-only except authorised correction.
-

AC. Job Work Processed Inventory

- ☐ Returned good material enters normal Processed Inventory.
- ☐ Job Work does not create a permanently separate processed-stock category.
- ☐ Production Source is marked Job Work.

- ☐ Job Work Number is preserved.
 - ☐ Receiving Location is preserved.
 - ☐ Processed Job Work material can later fulfil normal contracts.
-

AD. Job Work Re-Sortex

- ☐ Total processed Job Work receipts are aggregated.
 - ☐ User does not need to select every receipt manually.
 - ☐ Start Re-Sortex button exists.
 - ☐ Button displays currently available returned processed quantity.
 - ☐ Re-Sortex creates a new In-House Sortex Production Run.
 - ☐ Originating Job Work Number is preserved.
 - ☐ Original receipt references remain traceable.
 - ☐ Selected quantity reduces from Processed Inventory.
 - ☐ Re-Sortex output returns to Processed Inventory.
 - ☐ Re-Sortex wastage follows normal Store/Discard logic.
-

AE. Job Work Dashboard

- ☐ Active Job Works are visible.
- ☐ Material with Job Workers is visible.
- ☐ Job Work Processed This Month is visible.
- ☐ Processed Material Received is visible.
- ☐ Pending Job Work return quantity is visible.
- ☐ Owner can open Job Work details from Dashboard.

AF. Dashboard Production Analytics

- ☐ In-House production quantity is measurable.
 - ☐ Job Work production quantity is measurable.
 - ☐ Wastage-reprocessing recovery is measurable.
 - ☐ Sampling-rejected reprocessing is measurable.
 - ☐ Processed Inventory available for fulfilment is visible.
 - ☐ Wastage Inventory is visible.
 - ☐ Sampling-Rejected Inventory is visible.
-

AG. Audit Trail

- ☐ Production Store/Discard decisions are logged.
- ☐ Wastage reprocessing is logged.
- ☐ Fulfilment allocation is logged.
- ☐ Job Work creation is logged.
- ☐ Job Work Outward is logged.
- ☐ Job Work Inward is logged.
- ☐ Additional Job Work material is logged.
- ☐ Job Work Process Result changes are logged.
- ☐ Job Work closure is logged.
- ☐ Re-Sortex creation is logged.
- ☐ Old and new values are retained for edits.
- ☐ User, date and time are retained.

74. FINAL DEVELOPMENT PRINCIPLE

The revised system should be built around one central principle:

Every kilogram of material should always have a clear state, location and history.

At any point, the system should be able to answer:

What product is it?

How many KG are there?

Where is it?

Is it Raw, WIP, Processed, Wastage or Sampling-Rejected?

If Wastage, which Wastage Type is it?

Which Production or Job Work did it come from?

Has it been reprocessed before?

Is it available or already reserved?

Has it been sent outside for Job Work?

Has it returned?

Has it been allocated to a Contract?

Does that Contract require Sampling?

The UI should keep this complexity hidden wherever possible and provide the Production Team with simple actions, while the backend maintains complete stock traceability.

The intended result is a system where the Production Team can operate it without confusion, while the Owner receives a highly visual, accurate and detailed picture of **inventory, production, wastage, fulfilment, sampling and Job Work at any given time.**
